

Name _____

Date _____

1. Maria solved the following division problem by drawing an area model.

- a. Look at the area model. What division problem did Maria solve?

- b. Show a number bond to represent Maria's area model. Start with the total and then show how the total is split into two parts. Below the two parts, represent the total length using the distributive property and then solve.

$$(\underline{\quad} \div \underline{\quad}) + (\underline{\quad} \div \underline{\quad})$$

$$= \underline{\quad} + \underline{\quad}$$

$$= \underline{\quad}$$

2. Solve $42 \div 3$ using an area model. Draw a number bond and use the distributive property to solve for the unknown length.

3. Solve $60 \div 4$ using an area model. Draw a number bond to show how you partitioned the area, and represent the division with a written method.
4. Solve $72 \div 4$ using an area model. Explain, using words, pictures, or numbers, the connection of the distributive property to the area model.
5. Solve $96 \div 6$ using an area model and the standard algorithm.
